

Customer Journey Map

Project: Import Data using Transform Maps (Spreadsheet) Team ID: SWTID-2026-3453 Date: 1 October 2026

SCENARIO	ENTICE	ENTER	ENGAGE	EXIT	EXTEND
Preparing, importing, validating, mapping, and processing employee spreadsheet data in ServiceNow	How does the user become aware of the import process?	What do people experience as they begin the process?	In the core moments, what happens?	What do people typically experience as the process finishes?	What happens after the import experience is over?
Steps What steps does the user go through?	- Receive the spreadsheet requirement - Review required fields	- Prepare employee spreadsheet - Upload/import spreadsheet - Review Import Set	- Validate staged data - Run Transform Map - Map source to target fields - Use Employee ID	- Check transformed records - Confirm existing records updated - Confirm new records inserted	- Review resulting Employee records - Use the completed import as the new data state
Interactions What interactions do they have with people, systems, or data?	- Project instructions / import requirement - Spreadsheet file	- Spreadsheet - ServiceNow import interface - Import Set Table	- Import Set data - Transform Map - Employee table - Employee ID match	- Transformed employee records - Existing/new record outcome	- Employee records in ServiceNow - Completed imported dataset
Goals & motivations At each stage, what is the user trying to achieve?	- Understand what employee data is required - Prepare usable input	- Submit employee data for processing - Ensure the spreadsheet contains the required fields	- Get accurate validation and mapping - Ensure Employee ID correctly identifies the target record	Verify that records were updated or inserted as intended	Have employee information available in the Employee table in the expected state
Positive moments What makes this a good experience?	- Clear field requirements - Straightforward spreadsheet structure	- Data is accepted into the Import Set Table - Staging is easy to review	- Fields map correctly - Employee ID match behaves as defined - Correct update/insert action	Transformed records reflect the spreadsheet data correctly	Employee records are available with the imported information
Negative moments What causes frustration, confusion, or concern?	- Unclear input requirements - Inconsistent spreadsheet values	- Import data is difficult to validate - Unexpected staging values	- Incorrect field mapping - Employee ID not handled correctly - Wrong update/insert result	Record result does not match the intended spreadsheet data	Need to re-check imported employee records because of uncertainty
Areas of opportunity How might we make each step better?	- Keep the required employee fields explicit - Use a consistent spreadsheet format	- Make the temporary Import Set stage easy to review - Validate the supplied fields	- Keep source-to-target mappings explicit - Use Employee ID consistently as the unique identifier	Make update versus insertion outcomes easy to verify	Maintain a clear final state of employee records after the import
