

Project Design Phase-II

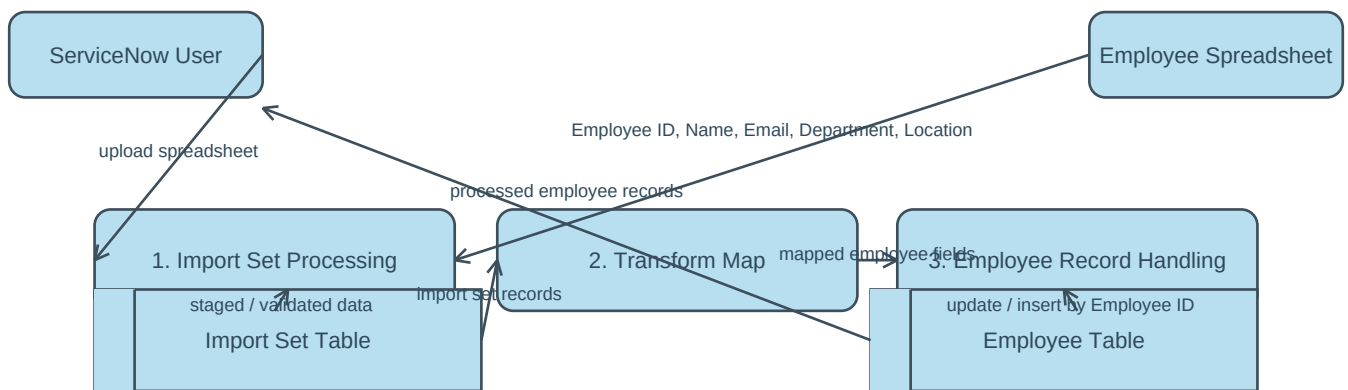

Data Flow Diagram & User Stories

Date	1 October 2026
Team ID	SWTID-2026-3453
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. It shows how employee data enters the ServiceNow import process, how the information is staged and transformed, and how the target Employee records are updated or inserted.

Data Flow Diagram – Employee Spreadsheet Import

Data stores: Import Set Table (temporary staging) and Employee Table (target records).

Flow summary: The ServiceNow user supplies the employee spreadsheet. The spreadsheet rows are loaded into the Import Set Table for temporary processing and validation. The Transform Map maps Employee ID, Name, Email, Department, and Location to the corresponding Employee fields. Employee ID is used to identify an existing employee for update or a new employee for insertion.

User Stories

Use the below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
ServiceNow User	Spreadsheet Employee Data Input	USN-1	As a ServiceNow user, I can prepare and provide an employee spreadsheet containing Employee ID, Name, Email, Department, and Location.	The spreadsheet contains the required employee fields and can be supplied to the import process.	High	Sprint-1
	Import Set Processing	USN-2	As a ServiceNow user, I can upload the employee spreadsheet so that its data is stored in the Import Set Table for temporary processing.	Spreadsheet rows are loaded into the Import Set Table for processing and validation.	High	Sprint-1
	Import Set Processing	USN-3	As a ServiceNow user, I can review the staged spreadsheet data before transformation.	Imported employee rows are available in the Import Set Table for validation.	High	Sprint-1

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
	Transform Map Field Mapping	USN-4	As a ServiceNow user, I can use a Transform Map to map Employee ID, Name, Email, Department, and Location to the corresponding Employee fields.	Each stated source field is mapped to its corresponding target Employee field.	High	Sprint-1
	Employee ID-Based Record Handling	USN-5	As a ServiceNow user, I can use Employee ID as the unique identifier when processing imported employee records.	Employee ID is used to identify whether a matching employee record already exists.	High	Sprint-1
	Employee ID-Based Record Handling	USN-6	As a ServiceNow user, I can update an existing Employee record when the imported Employee ID already exists.	The matching Employee record is updated with the mapped spreadsheet values.	High	Sprint-1
	Employee ID-Based Record Handling	USN-7	As a ServiceNow user, I can insert a new Employee record when the imported Employee ID does not already exist.	A new Employee record is created with the mapped spreadsheet values.	High	Sprint-1
	Employee Record Verification	USN-8	As a ServiceNow user, I can verify the resulting Employee records after the Transform Map has processed the spreadsheet.	Existing records reflect updates and new employee records are present in the target Employee table.	Medium	Sprint-2
