

PROJECT REPORT

Import Data using Transform Maps (Spreadsheet)

Project Design / Documentation Date	1 October 2026
Team ID	SWTID-2026-3453
Technology Platform	ServiceNow
Project Type	Employee data import using Import Sets and Transform Maps

1. INTRODUCTION

1.1 Project Overview

The project, **Import Data using Transform Maps (Spreadsheet)**, provides a controlled ServiceNow workflow for importing employee information from a spreadsheet into the target Employee table. The spreadsheet contains Employee ID, Name, Email, Department, and Location. The imported rows are first stored in an Import Set Table for temporary processing and validation. A Transform Map then maps the source fields to the corresponding Employee fields. Employee ID is used as the unique identifier to distinguish existing employee records from new employee records.

When the Employee ID already exists, the corresponding employee record is updated with the mapped spreadsheet information. When the Employee ID does not exist, a new Employee record is inserted. The workflow therefore provides a structured path from spreadsheet input to target employee records.

1.2 Purpose

- Reduce repetitive manual entry when employee information is available in spreadsheet form.
- Provide a temporary staging area for imported employee rows before transformation.
- Ensure source spreadsheet fields are mapped to the intended Employee fields.
- Use Employee ID consistently to support update-versus-insert handling.
- Provide a workflow that can be reviewed and verified after transformation

2. IDEATION PHASE

2.1 Problem Statement

Employee information stored in a spreadsheet must be transferred into ServiceNow without losing field relationships or creating duplicate employee records. Direct manual entry can be repetitive, while an uncontrolled import can lead to incorrect field mapping or incorrect handling of existing employees. The project addresses this by staging the spreadsheet data, validating it, mapping the fields through a Transform Map, and using Employee ID as the unique identifier for update or insertion.

2.2 Empathy Map Canvas

Think / Feel	Hear	See
Wants accurate employee data; values reliable imports; is concerned about incorrect updates or inserts.	Import instructions; Employee ID requirements; data accuracy expectations.	Spreadsheet rows; Import Set records; Transform Map field mappings; Employee records.
Say / Do	Pain	Gain
Prepares the spreadsheet, uploads it, reviews staged data, runs the transformation, and verifies records.	Inconsistent fields, validation issues, incorrect mappings, and wrong update/insert decisions.	Correctly mapped fields, validated staged data, correct Employee ID matching, and accurate target records.

2.3 Brainstorming

Idea Area	Project-specific idea
Data Preparation	Keep Employee ID, Name, Email, Department, and Location consistent in the spreadsheet.
Import Set Processing	Load spreadsheet rows into the Import Set Table for temporary processing and validation.
Transform Mapping	Map every source employee field to its corresponding target Employee field.
Record Identification	Use Employee ID as the unique identifier for matching.
Update / Insert	Update a matching Employee record; insert a new record when no matching Employee ID exists.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey map

Stage	Steps	Interactions	Goals / Motivation
Entice	Receive employee spreadsheet requirement and review fields.	Review source file and required employee columns.	Understand what must be imported.
Enter	Prepare and upload the spreadsheet.	Provide file to the ServiceNow import workflow.	Start the employee import.
Engage	Validate staged rows and run the Transform Map.	Review Import Set data and field mappings.	Transform records correctly.
Exit	Check target Employee records.	Verify updated and newly inserted records.	Confirm the expected outcome.
Extend	Reuse the same workflow for later employee spreadsheet imports.	Repeat controlled import and verification.	Maintain consistent employee data processing.

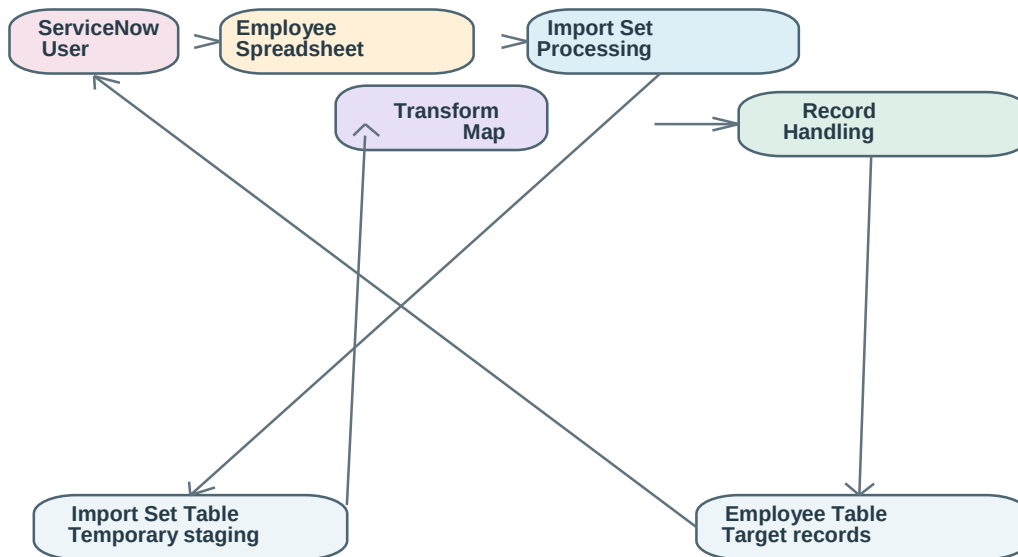

3.2 Solution Requirement

Requirement	Description
FR-1 Spreadsheet Employee Data Input	Use a spreadsheet containing Employee ID, Name, Email, Department, and Location.
FR-2 Import Set Processing	Store uploaded spreadsheet data in the Import Set Table for temporary processing and validation.

FR-3 Transform Map Field Mapping	Map Employee ID, Name, Email, Department, and Location to corresponding Employee fields.
FR-4 Employee ID-Based Record Handling	Use Employee ID as the unique identifier: update an existing employee when the ID exists and insert a new employee when it does not.
NFR-1 to NFR-6	Usability, security, reliability, performance, availability, and scalability requirements support a controlled and repeatable ServiceNow import workflow.

3.3 Data Flow Diagram

ServiceNow Employee Import Workflow

The DFD shows the flow from spreadsheet input to Import Set staging, transformation, Employee ID-based record handling, and verification of the target Employee records.

3.4 Technology Stack

Layer	Technology / Service	Role in the project
User Interface	ServiceNow Web UI	User access to the import and verification workflow.
Import Processing	ServiceNow Import Sets	Accept and stage spreadsheet data for processing.
Temporary Data	Import Set Table	Temporary storage of imported employee rows.
Transformation	ServiceNow Transform Map	Map source fields to target Employee fields.
Target Data	Employee Table	Store resulting employee records.
Identifier	Employee ID	Match existing employee records and determine update or insert.
Platform	ServiceNow Cloud Platform	Hosts the application workflow and platform-managed data.

4. PROJECT DESIGN

4.1 Problem Solution Fit

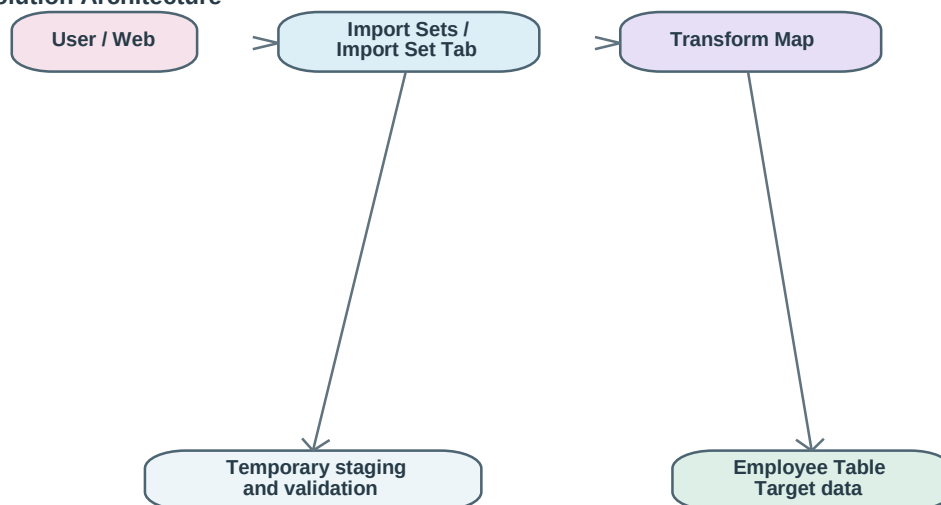

Area	Project-specific fit
Customer Segment	ServiceNow users / administrators responsible for employee data import.
Jobs / Problems	Import spreadsheet employee data, validate rows, map fields, and correctly update or insert employee records.
Triggers	A need to load a new employee list or refresh employee information from a spreadsheet.
Customer Constraints	Consistent spreadsheet fields, valid Employee IDs, correct access, and accurate existing records.
Available Solutions	Manual record entry or a controlled ServiceNow Import Set and Transform Map workflow.
Root Cause	Spreadsheet data must be transferred into structured ServiceNow records while preserving identity and field relationships.
Solution	Stage the data in an Import Set Table, validate it, transform it through field mappings, and use Employee ID for update/insert handling.

4.2 Proposed Solution

- Use an employee spreadsheet as the source data.
- Load spreadsheet rows into the Import Set Table for temporary processing and validation.
- Configure a Transform Map for Employee ID, Name, Email, Department, and Location.
- Use Employee ID as the unique identifier for matching existing employee records.
- Update existing Employee records when Employee ID matches.
- Insert new Employee records when Employee ID does not match an existing record.
- Verify the resulting target Employee records after transformation.

4.3 Solution Architecture

Solution Architecture

Employee ID determines whether the target record is updated or inserted.

The architecture uses ServiceNow platform capabilities rather than a separate application server or external database. The Import Set Table acts as the temporary staging layer, while the Employee Table is the target data store. The Transform Map provides the mapping and record-processing logic.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Sprint	Work Items	Story Points	Planned Duration
Sprint-1	Spreadsheet preparation; Import Set setup; staging and validation.	8	1–6 Oct 2026
Sprint-2	Transform Map configuration; field mapping; Employee ID matching; update handling.	10	8–13 Oct 2026
Sprint-3	New-record insertion; final verification; testing and documentation.	5	15–20 Oct 2026

Planned total: 23 story points across three sprints. The planning sequence follows the dependency order: source preparation → staging → transformation → update/insert handling → verification and documentation.

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Performance testing for this project focuses on whether the import workflow processes the supplied spreadsheet efficiently and consistently without unnecessary application-layer processing. The test cases below define the expected checks for the completed ServiceNow implementation.

Test ID	Test Scenario	Expected Result	Status
PT-01	Import a valid spreadsheet containing the five stated employee fields.	Rows are accepted into the Import Set Table and are available for processing.	To be verified
PT-02	Run the Transform Map on staged employee records.	Source values are mapped to the corresponding Employee fields.	To be verified
PT-03	Import a row whose Employee ID already exists.	The matching Employee record is updated rather than duplicated.	To be verified
PT-04	Import a row whose Employee ID does not exist.	A new Employee record is inserted.	To be verified
PT-05	Review the target Employee table after processing.	Processed records reflect the expected update/insert outcome.	To be verified

Note: No measured runtime, row-count benchmark, or production performance result was supplied with the project materials. Therefore, this report does not invent numerical performance results.

7. RESULTS

7.1 Output Screenshots

The final report template calls for output screenshots. No actual ServiceNow screenshots were supplied with the project materials used to generate this report, so the spaces below are clearly marked for insertion of the completed-project screenshots rather than presenting illustrative images as real outputs

Import Data using Transform Maps (Spreadsheet)

TeamOverviewWorkspaceKanban

Milestone 1 : Creation Of Spreadsheet And Table

EpicComplexity: MediumDuration: 40m

Description

The spreadsheet is used to import employee information into ServiceNow using Import Sets and Transform Maps. It contains employee details such as **Employee ID, Name, Email, Department, and Location**. The uploaded spreadsheet data is first stored in an Import Set Table for temporary processing and validation. A Transform Map is then used to map these fields to the corresponding fields in the target Employee table. The system uses **Employee ID** as the unique identifier to identify existing employees and update their records, while new employees are inserted as new records.

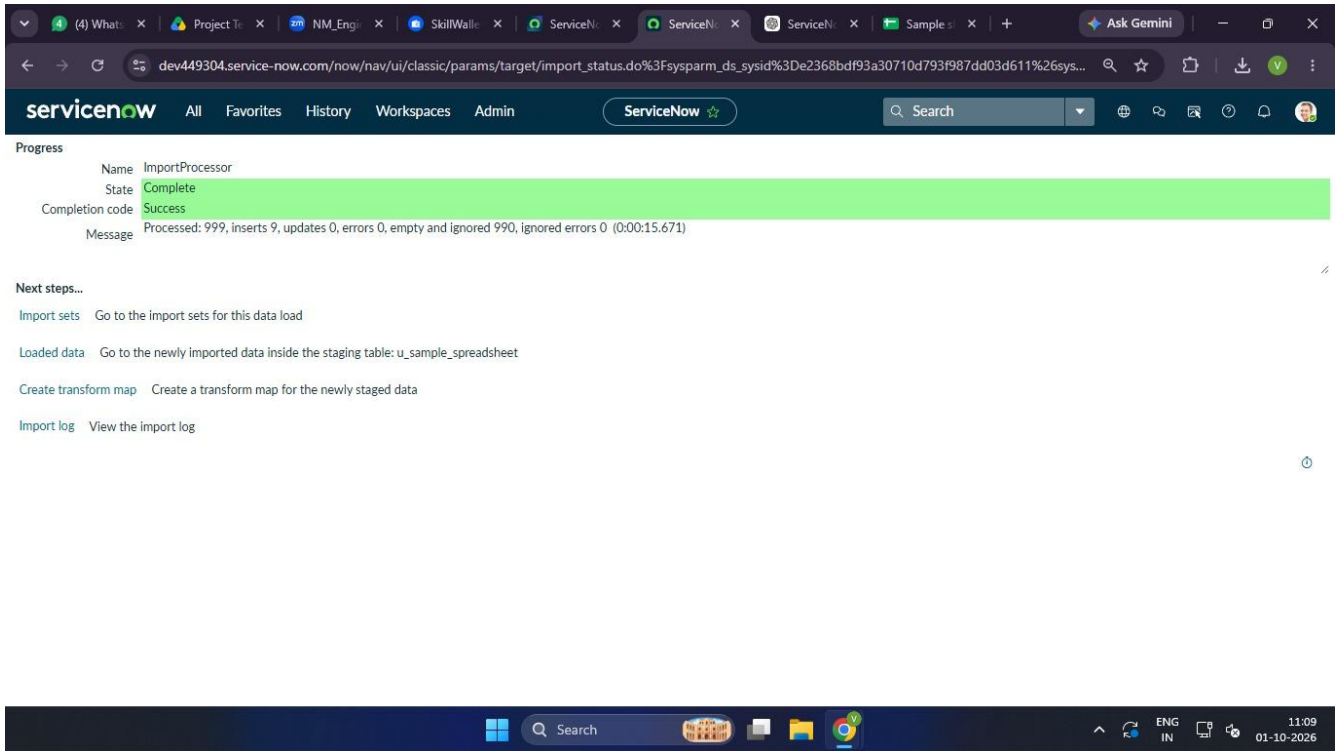

Figure 1. Employee spreadsheet containing Employee ID, Name, Email, Department, and Location

Figure 2. ServiceNow import workflow showing staged data and Transform Map field mapping.

8. ADVANTAGES & DISADVANTAGES

Advantages	Disadvantages / Limitations
Reduces repetitive manual employee record entry.	The workflow depends on a correctly prepared source spreadsheet.
Provides an Import Set staging area for temporary processing and validation.	Incorrect or missing Employee IDs can affect record matching.
Uses a defined Transform Map for consistent field mapping.	The stated solution is specific to the ServiceNow environment and configured target fields.
Employee ID-based matching supports update versus insert handling.	No external data-quality or enrichment service is included in the stated workflow.
Can be reused for later employee spreadsheet imports with the same structure.	Actual performance depends on the ServiceNow instance and the size/quality of the supplied data.

9. CONCLUSION

The **Import Data using Transform Maps (Spreadsheet)** project defines a structured method for transferring employee information from a spreadsheet into ServiceNow. The workflow uses Import Sets for temporary staging and validation, a Transform Map for field-level mapping, and Employee ID as the unique identifier for update or insert handling.

The proposed workflow addresses the core data-import problem without requiring a separate application server or database. The project documentation establishes the problem, requirements, user stories, architecture, planning approach, and test scenarios needed to implement and verify the solution.

10. FUTURE SCOPE

- Add more formal spreadsheet validation rules for required fields and data formats.
- Extend the workflow to handle additional employee attributes when required by the target Employee table.
- Introduce stronger import error reporting and a clearer review workflow for rejected rows.
- Add audit-oriented reporting for update and insert outcomes.
- Support additional approved employee data sources while retaining controlled Transform Map processing.

11. APPENDIX

Source Code (if any)

No standalone application source code is required for the stated ServiceNow platform workflow. The implementation consists of ServiceNow configuration objects such as Import Sets, Import Set Table processing, Transform Map field mappings, and Employee record handling.

Dataset Link

The project uses an employee spreadsheet as the input dataset. No public dataset URL was supplied with the project materials, so no external dataset link is claimed in this report.
