

Project Design Phase

Solution Architecture

Date	1 October 2026
Team ID	SWTID-2026-3453
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

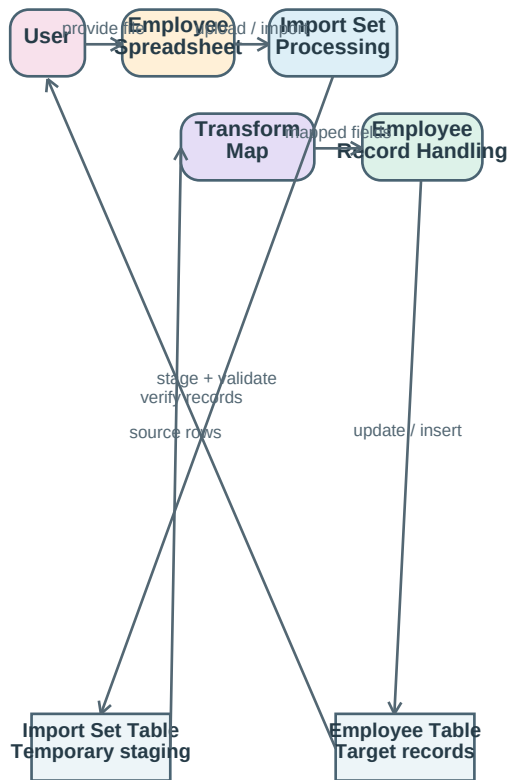

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Example - Solution Architecture Diagram:

Figure 1: Solution Architecture and Data Flow

Employee ID is the unique identifier used to determine update of an existing record or insertion of a new record.

Figure 1: Architecture and data flow of the employee spreadsheet import solution

Architecture flow: The ServiceNow user provides an employee spreadsheet. The data is imported into the Import Set Table for temporary processing and validation. A Transform Map maps Employee ID, Name, Email, Department, and Location to the corresponding Employee fields. Employee ID is used to determine whether the target Employee record should be updated or a new record inserted.
